Application US/09078347A
Patent No. 6132968
GENERAL INFORMATION:
APPLICANT: Le, Xiao-Chun
APPLICANT: Wenfeld, Michael
APPLICANT: Xing, James Z.
TITLE OF INVENTION: Methods for Quantitating Low Level
TITLE OF INVENTION: Modifications of Nucleotide Sequences
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
                     Indels

Sequence 2, Application US/09046992

Sequence 2, Application US/09046992

Patent No. 6140066

BENERAL INFORMATION:

APPLICANT: Lorberboum-Galski, Haya

APPLICANT: Larkoni, Shal

APPLICANT: Ben-Yehidah, Ahmi

TITLE OF INVENTION: METHODS OF CANCER DIAGNOSIS

TITLE OF INVENTION: USING A CHIMERIC TOXIN

NUMBER OF SEQUENCES: 7

CORRESPONDENCE ADDRESS:

ADDRESSEE: Pennie & Edmonds, LLP

STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ZIP: 10036-2811

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1, Application US/08405615
Patent No. 5602095
GENERAL INFORMATION:
APPLICANT: Pastan, Ira
APPLICANT: FitzGerald, David J.
TITLE OF INVENTION: Recombinant Pseudomonas Exotoxin with
TITLE OF INVENTION: Increased Activity
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ellen L. Weber
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   E: Ellen L. Weber
One Market Plaza, Steuart Tower, Suite 2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              OFEWATING SYSTEM: PC_DOS/MS-DOS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Human brain poly-ADP-ribose-polymerase protein.

(first entry)

```
This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NDP<sup>+</sup>-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from call death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP2 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IQLLEDDAQRNFSVWMRWGRVGKMGQHSLVACSGNLNKAKEIFQKKFLDKTKNNWEDREK 180

This invention describes novel 4-substituted 2H-phthalazin-1-one derivatives (I) which are used for the treatment or prophylaxis of diseases associated with elevated poly-ADP-Tibose)-polymerase (PARP): CC diseases associated with elevated poly-ADP-Tibose)-polymerase (PARP): EC 2.4.2.30) activity. The products of the invention have nootropic, neuroprotective, carciant, vasciropic, anticonvulsant, vascoring, antibacterial, immunosuppressive, antinflammatory, antithemmatic, antibacterial, immunosuppressive, antinflammatory, antithemmatic, antibacterial, immunosuppressive, antinflammatory, antithemmatic, antibacterial, antidiabetic. (I) are especially used for treating or preventing controlly rehalf and an assive bleeding, especially apoplexy or spinal-cranial trauma; or Alzheimer's disease, Huntington's disease or parknison's disease or preventing ischemic damage after renal ischemia or during and after (specifically renal damage after renal ischemia or during and after complex parantation or heart damage after cardiac ischemia), treating confically generalized epileptic attacks (e.g. temporal lope of tonic-clonic attacks) or partial epileptic attacks (e.g. temporal lope and complex partial attacks), treating microinfarction (e.g. during and after heart valve replacement, aneurysm rescentioning and heart cardial attacks), after PCTA or by pass operations) or peripheral arteries (e.g. after PCTA or by pass operations) or peripheral arteries (e.g. after PCTA or by pass operations) or peripheral arteries or after its mechanical or drug-induced lysis and treating tumors and context metastasis, sepsis and septic shock, inflammatory and strongly and septic shock, inflammatory and strongly inhibit PARP homologs, specifically contivity (e.g. with K_I values of 1-20 M) and high selectivity for PARPI (generally by a factor of more than 5).
                                                                                      Human; poly ADP-ribose polymerase; PARP; neuroprotective; nootropic; creebzoprotective; antiparkinsonian; nephrotropic; cardiant; vasotropic; anticonvulsant; cytostatic; antibacterial; immunosuppressive; treatment; antinflammatory; antirheumatic; antiarthritic; antidiabetic; epilepsy; 2H-phthalazin-1-one derivative; neurodegenerative disease; tumor; neuronal damage; Alzheimer's disease; mioridiquoton's disease; metastasis; parkinson's disease; ischemic damage; nicrolnfarction; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drugs for inhibiting PARP or especially homologous enzymes comprising 4-substituted phthalazinone derivatives, useful e.g. for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This sequence represents human poly(ADP-ribose) polymerase (hPARP2).

This protein causes the covalent addition of polymers of ADP-ribose construction causes the covalent addition of polymers of ADP-ribose to protein targets. HPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage considerive stress and the part of a construction of the DMA. HPARP2 may be used, to identify antagonists which can be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, e.g. ischemic stroke, hemorrhagic shock, myocardial ischemia or infarction, carebral vasospasm: rheumatoid, osteo- or gouty carthritis, spondylitis; Behcef's disease; sepsis, septic or endotoxic shock, gram negative or positive sepsis, toxic shock syndrome; multiple or gran injury syndrome secondary to septicemia, trauma, or hemorrhage; allergic or vernal conjunctivitis, uveitis, thyroid-associated ophthalmopathy; eosinophilic granuloma; asthma, chronic bronchitis, ophthalmopathy; eosinophilic granuloma; asthma, chronic bronchic obstructive pulmonary disease, silicosis, plumonary sarcoidosis, pleurisy, alveolitis, vasculitis, neinforme; graft versus host disease, content or anothic dermation; atherosclerosis; systemic lupus of formation, scar tissue formation; atherosclerosis; systemic lupus crythematosus, autoimmune thyroiditis, multiple sclerosis; Reynaud's sydneriul comphritis; inflammatory dermatose contect or atopic dematitis, portasis, unliquatis, inflammatory dermatose contect or atopic dematitis, portasis, unliquatis, inflammatory dermatose contect or atopic dematitis, portasis, unliquation due to infection; meningitis, encephalitis, and brain and myalajas contents and papedesis; alcoholic hepatitis; and brain and myalajas contents and inspedence or and dispedesis alcoholic hepatitis; bacterial penance or and myalajas contents and dispedesis alcoholic hepates, button and myalajas contents and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antigen-antibody complex mediated diseases; hypovolemic shock; Type 1 diabetes mellitus; acute and delayed hypersensitivity; disease states due to leukocyte dyscrasia and metastasis; thermal injury; garanulocyte transfusion associated syndromes; and cytokine-induced toxicity. hPARP2 and antibodies to it, can also be used to diagnose these

This sequence represents a novel human poly(ADP-ribose)
synthetase, sbhPARS2. The invention also relates to fragments,
variants and sequences with at least 95% identify to the sbhPARS2
comprising an sbhPARS2 nucleic acid sequence; the recombinant expression
comprising an sbhPARS2 nucleic acid sequence; the recombinant expression
comprising an sbhPARS2 nucleic acid sequence; the recombinant expression
compounds which in this part as vaccines for inducing an immunological
response in a mammal. The sbhPARS2 protein is useful for identifying
compounds which inhibit or stimulate its activity or expression level.
Such agonists and antagonists of sbhPARS2 are useful for treating human
diseases including ischaemia and ischaemic tissue injury (e.g., cerebral
and cardiac ischaemia, myocardial infarction, stroke), inflammation,
autoimmune disease (e.g., diabetes, multiple sclerosis) and
cutoimmune disease (e.g., diabetes, multiple sclerosis) and
cutoimmune disease (e.g., diabetes, multiple sclerosis) and
cutoimmune disease (e.g., diabetes, multiple sclerosis) and
cletecting mutations in the associated gene; as hybridisation probes
to isolate full-length sbhPARS2 conds and sbhPARS2 genomic clones; and
for chromosome localisation studies. The sbhPARS2 genomic clones; and
condice and immunogen to produce antibodies for therapeutic use. sbhPARS2
proteins, nucleotides and antibodies are also useful in screening methods
contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         480

                                                                      The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POI) (ADD-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, mailgnant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, mentological (e.g parkinsonism, meningities-associated intracranial complications and isohaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes primer sets for synthesising 5602

[10] The present invention describes primer sets for synthesising 5602

[10] The present invention in the specification. Where a primer set

[10] The complementary strand of a polynucleotide which comprises one of

[11] The 5602 nucleotide sequences defined in the specification, where the

[12] Oligonucleotide comprising a sequence complementary to the

[13] Complementary strand of a polynucleotide which comprises a 5'-end

[13] Sequence and an oligonucleotide comprising a sequence complementary to a complementary strand of a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence which comprises a 1-east 15 nucleotides and the complementary to a complementary strand of a polynucleotide which comprises a 1-east 15 nucleotides and the complementary to a ligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for the particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by
                                                                             456

the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH13639 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant, hyperprobliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

(Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a discorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                  The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. This protein contains amino acids 1-662 of hPARPI fused upstream of amino acids 230-583 of hPARP2. The CDNA encoding this sequence was amplified using the primer sequences given in AAC85312-40 and AAC85342-51. The fusion protein coding sequence was cloned in a baculovirus expression vector for the expression of the fusion protein coding sequence was cloned in a polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis

Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, and for treating cancers, rheumatoid arthritis

Claim 11; SEQ ID No 414; 687pp; English.

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and CDNA (AAS34767-AAS35050) and DNA sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders involving neoplastic disease such as hyperproliferative disorders involving neoplastic disease such as concer, brain stem glioma, adult liver cancer, childhood cerebellar cancer, brain stem glioma, adult liver cancer, childhood cerebellar astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may astrocytoma, the polypucledrisk sequences of the invention are cancer and disorders, pulmonary disorders, reproductive disorders, and renal disorders. The polypucleotide sequences of the invention are also useful in gene therapy. AAU21861 represent the novel human coplastic disease associated polypeptides of the invention.

CC also useful in gene therapy. AAU21861 represent the novel human coplastic disease associated polypeptides of the invention.

CC also useful in was obtained in electronic format directly from WIPO cc at ftp.wipo.int/pub/published_pct_sequences.

2001-025335/03. N-PSDB; AAC85314. New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis

Example 2; Page 100-01; 129pp; English.

This sequence is encoded by the 5' fragment of the human parp2 (poly(ADP-ribose) polymerase) cDNA. The cDNA sequence was amplified using the primers given in AAC85307-13. DNA derived from spleen and testis cDNA libraries were used as templates. The primers given in AAC85315-17 were used to confirm the sequence of the 5'-IPPARP2 in AAC85318-17 were used to confirm the sequence of the 5'-IPPARP2 closed to help determine that hPARP2 has an open reading frame of closed to help determine that hPARP2 as no open reading frame of 1080 nucleotides. The protein of the invention, hPARP2 causes the covalent addition of polymers of AADP-ribose to protein targets. The hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. The APARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to to dispanse these conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA processing; human; mouse; rabbit; goat; horse; cat; gene therapy; chicken; sheep; immunosuppressive; antiarthritic; vasotropic; antiproliferative; cytostatic; cardiant; neuroprotective; cerebroprotective; nootropic, antibacterial; virucide; fungicide; cancer; ophthalmological; vulnerary; gene therapy; autoimmune disease; neoplasm; hyperproliferative disorder; breast, liver; cardiovascular disorder; nervous system disorder; bacterial infection; fungal infection; viral infection; ocular disorder; endocrine disorder; wound healing; skin aging; corgan transplantation; tissue regeneration; anti-infertility; DNA repair protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (poly(ADP-ribose) polymerase) cond. The cond sequence was amplified using the primers given in AAGB315-17. DNA derived from a testis cDNA library was used as a template. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct admage to the DNA. hPARP2 may be used to identify antaqonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              284 ALMEACNEFYTRIPHDFGLRTPPLIRTQKELSEKIQLLEALGDIEIAIKLVKTELQSPEH 343

Sequences AAU20116-AAU20147 represent the DNA repair and processing polypeptides of the invention. DNA repair and processing polypeptides and their associated polymoutectides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by detecting the presence or absence of a mutation in a DNA repair and processing polymoutlectide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular clisorders such as conneal infection, endocrine disorders such as corneal infection, endocrine disorders such as corneal infection, endocrine disorders such as corneal infection, endocrine disorders such as Crohn's disease, renal disorders such as allomerulonephritis and creapiratory disorders such as asthma and pleurisy. The polypeptides can also be used to aid wound healing, to prevent skin aging due to subburn, and the processing and the contract of the contrac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to maintain organs before transplantation, to regenerate tissues and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hyperproliferative disorder; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; pulmonary disorder; cardiovascular disorder; renal disorder; neuroprotective; cytostatic; anti inflammatory; vasotropic.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 187, Sequence 187, Sequence 24, Algorithms of Sequence 2, Alg
